

ServiceNow Flow Designer Project

Phase 1 – Ideation

Employee Leave Approval Automation

Objective: Create a ServiceNow Flow Designer workflow that automatically processes employee leave requests and routes them for manager approval.

Trigger: When a new leave request is submitted.

Required Inputs

1	Employee name and ID
2	Leave type
3	Start and end dates
4	Reason for leave

Flow Steps

1	Trigger when the request is submitted
2	Check whether required information is available
3	Send approval request to the employee's manager
4	If approved, update the request as Approved
5	If rejected, update the request as Rejected
6	Send a notification to the employee

ServiceNow Components: Flow Designer, Service Catalog, Approval action, Conditions, Notifications

Expected Outcome: Reduces manual follow-up and gives employees a clear approval status.

Interview Explanation: I designed this project using ServiceNow Flow Designer to automate the request lifecycle. The flow starts from a trigger, applies conditions, performs actions or approvals, creates tasks when required, and sends notifications to the relevant users.
